

Nuclear Safety

This is a whole set of methods, of disciplines, the objective of which is to make sure that no accident may occur, at any time, in any of the existing nuclear plants, or in the plants under construction. This concerns the whole life cycle of all equipments.

We worked on several aspects:

I. Natural risks

The evaluation of natural risks (for instance earthquakes) concerns nuclear safety, but more generally all activities, including transportation. One needs data which are reliable enough, so that the probability of occurrence of each risk may be estimated, as well as the possible consequences.

II. Probabilistic methods for nuclear safety

A safety concern is usually addressed by means of scenarii, which describe the occurrence of an accident and its consequences. Many parameters may appear; the methods built by SCM allow a "hierarchy" of these parameters, that is a ranking in order of importance. Those which appear first in this ranking are those which deserve closest attention.

Our method also allow to find the "dangerous zones" in the space of configurations: this is the set of all values, for the control parameters, which may lead to dangerous situations, such as an important increase in temperature.

III. Methodological help to concerned institutions

We worked with almost all actors of the French Nuclear Sector, and in particular:

A. Institut de Radioprotection et de Sûreté Nucléaire

We had a cooperation agreement (2010-2015) with the IRSN, under the theme "Probabilistic Methods for Nuclear Safety". Our main concerns are:

- improving measurements;
- help for inspections;
- improving the methodology in the probabilistic safety studies;
- taking uncertainties into account in computational codes;
- computing economical indicators;
- evaluating the performance of a network of sensors, such as the TELERAY network;
- evaluating the capacities of the surveillance system of the future EPR reactor;
- evaluating the consequences of malfunctions in sensors' networks.

Most of these works were published.

B. Nuclear Energy Agency, OCDE

The NEA is an intergovernmental organization, for nuclear studies, which gathers countries from North America, Europe, and Asia. Its purpose is to share the best practices in the domain of nuclear energy.

The NEA has databases of type "archive", such as the EXFOR database; they contain information relative to nuclear reactions under the form of numerical data and text. NEA also has "evaluated" databases, such as ENDF, which were treated by experts. The result of this treatment is usually the definition of a continuous curve, from isolated experimental points.

The questions we had to face concern the existence of aberrant data in the archive databases and poor evaluations in the evaluated databases. We had 5 contracts (from 2010 to 2016) and we developed robust probabilistic tools, allowing NEA to detect aberrant data, both isolated or in groups.

Most of these works were published.

IV. Publications

1. Books

Bernard Beauzamy: *Nouvelles Méthodes Probabilistes pour l'évaluation des risques*. SCM SA. ISBN 978-2-9521458-4-8. ISSN 1767-1175, april 2010 (in French).

Olga Zeydina - Bernard Beauzamy: *Probabilistic Information Transfer*, SCM SA, ISBN 978-2-9521458-6-2, ISSN 1767-1175, april 2013 (in English).

Bernard Beauzamy: *Méthodes probabilistes pour la gestion des risques extrêmes*. SCM SA, ISBN: 978-2-9521458-9-3, ISSN: 1767-1175, june 2015 (in French).

2. Ph.D. Thesis

Olga Zeydina: Probabilistic Methods for Nuclear Safety, december 2011.
